An Overview on the Overview Page

On a high level

Entry-level view with displayed content on various types of cards.
Should be designed to show the context and task area **for one specific role.**
Content of **different sources** on one single screen.
Micro actions enable the **user to interact** with the cards.

Definition

The overview page (OVP) is a data-driven SAP Fiori app type and floorplan that provides **all the information a user needs in a single page**.
The content is based on the user's specific **domain or role**.
It allows the user to **focus** on the most important tasks, and view, filter, and react to information quickly.
Each task or topic is represented by a card (or content container).
The overview page acts as a UI framework for **organizing multiple cards on a single page**.
The overview page is based on SAP Fiori Elements technology.
It uses **annotated views of app data**, meaning that the app content can be tailored to the domain or role.
Different types of cards allow you to visualize information in an **attractive and efficient way**.

How the Overview Page looks like on different devices

© Source: SAP

The structure of the Overview Page

Dynamic Page Header

Enables **filter possibilities** via Smart Filter Bar (expandable/collapsible).

User personalization via **Variant Management** for pre-configured versions of the app (e.g. pre-define filters, arrange and hide cards, etc.).

Content of the page

The content is arranged by a collection of different **card** types.

Best Practices to optimize UX with the Overview Page

- Only show cards, that **really** support the specific role or task
- **Highlight important** information (e.g. semantic colors or charts) to attract attention
- **Balance** your card types for diversity to improve recognition
- Think about the **order and size** of your cards:
  Important ones first and/or big
- **Group cards**, which semantically belong together
- Use **easily readable** texts and **active voice** for interaction

When to use it and when not to?

Use it in these cases

Your context is a specific role or domain and you want to provide an entry point.
Information of several sources or applications should be shown at once to interact with the whole context.
You want to visualize information in different formats (e.g. tables, charts and lists) within one screen.
You have at least three meaningful cards to show.

Do not use it in those cases

A very high level view of the context is sufficient, no need for detailed information.
You just want to use the cards as navigation to further apps without actually showing something.
-> In this case use the Fiori Launchpad.
You don’t want to show tasks of a domain/role, instead you just show information of a single object.
-> In this case use the Object Page.
You basically have only one application and struggle to define three cards at all.
-> In this case also use the Object Page.

Differences to Object Page and Fiori Launchpad

Launchpad Home Page	Overview Page
Framework (given)	SAP Fiori application (optional)
“Birds-eye” view	“Street-level” view
Single point of entry	Specific business context for a role
One SAP Fiori launchpad per user	Multiple overview pages per user possible
Access to all the user’s favourite applications	Selected applications are presented as cards
Uses tiles	Uses cards
No actions	Micro actions

Overview Page	Object Page
Role-based	Object-based
“Street-level” view	“Details” view
Heterogeneous information	Homogeneous information

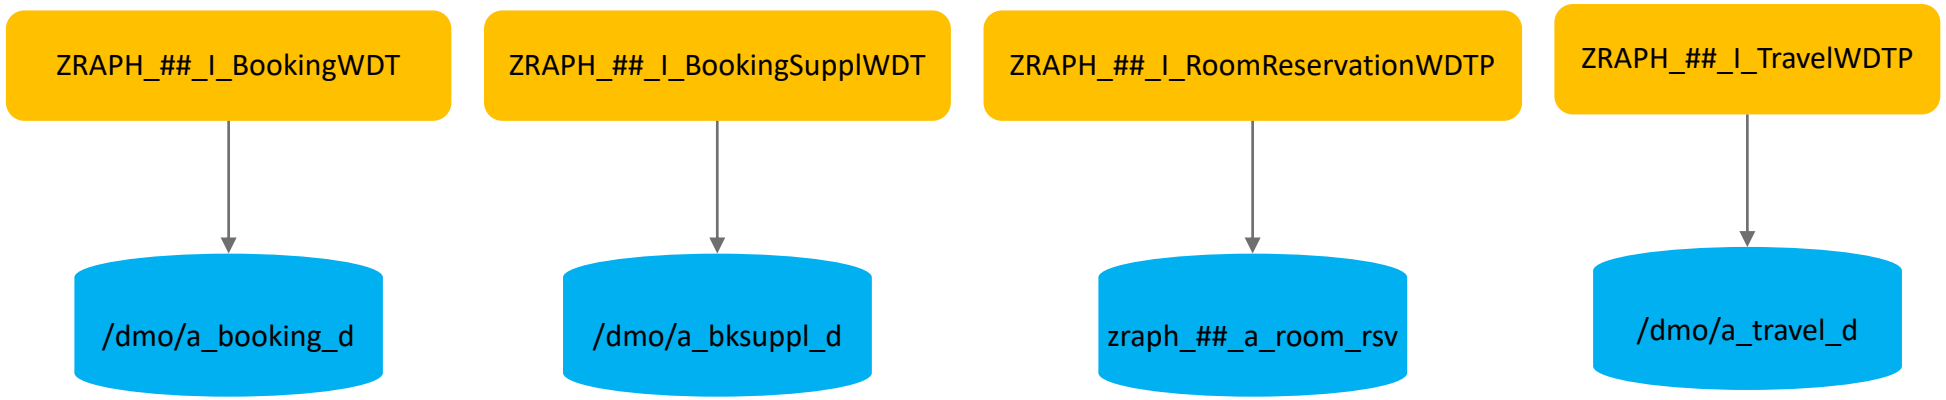
Course Scenario for the Overview Page

Initial situation

For the List Report, some interface views have already been created.

These views build up the lower level of the virtual data model and are therefore reusable for the OVP.

The consumption views will not be reused, as they are specific for the List Report.



Course Scenario for the Overview Page

Target image

We will build our own consumption views on top of the existing interface views.

In contrast to the List Report, we will use a technique to directly publish an OData Service from the consumption views, without creating a service binding first.

One of these new services provides the frame and filter options for the OVP itself.

Each of the other newly created services will provide the data and annotations for a specific card on the OVP.

An Overview on Cards

On a high level

A card represents a **quick preview** on the content of another application in the common case.
Each card represents **a specific topic, task or perspective**.
Cards are **powerful** and provide an appealing look on information.
There is a variety of **different visualization** types.

Harmonized and powerful information

The Overview Page acts as a UI framework to organize multiple cards for a single role on a single page.
Each relevant task is represented by a separate card – often a container for the content of another liked app.
Technically cards use UI annotations to render the content, similar to other app types of Fiori Elements.
They allow the OVP to show content of different sources side by side without the need to switch screens.
Cards differ in the content, they show (e.g. chart, list or table) and can also vary in their size depending on the content.
Cards never have editable fields, but they might contain actions (buttons) to enable some interaction by the user.

The Anatomy of Cards

How a card is built-up

A card contains a header area and a content area – both are mandatory.
Some card types have a footer area to add action buttons.

The header can be used to
- indicate, what the card is about
- work as navigation area to open the referenced parent app
- display a counter (relation of items on the card and total number of items)

The content shows the application content by technically embedded SAPUI5 controls.
Those controls specify the properties and data format to be shown.

  - Table Card
  - List Card
  - Stack Card
  - Link List Card
  - Analytical Card
- Navigation and Card configuration

Table Card

Key capabilities

Each row is selectable to navigate to the object details (e.g. Object Page).

The header can navigate to all items of the list (e.g. List Report).

The counter provides the relation to the total number of items.

The number of columns, which can be shown, is limited.

No action buttons are possible for this type of card.

Sorting can be added by the developer.

KPI coloring is possible and recommended (as long as meaningful).

List Card

Key capabilities

List cards display a set of items or links in a list format.

Types are List Card, Bar Chart List Card and Link List Card.

It is also possible to add icons or images to the displayed rows.

Standard list items show 3 pieces of information, extended list items show 6.

KPI coloring is possible via UI annotations.

A View Switch can be added to steer the sorting.

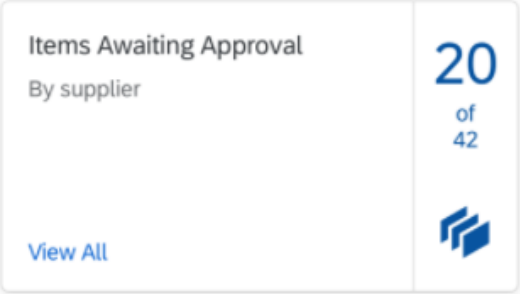
Stack Card & Quick View Card

Stack Card

This is directly shown, when the user opens the Overview Page.

Left area enables navigation to all items (e.g. per List Report).

Right area opens the Quick View Carousel.



Quick View Card

This is shown, when the User clicked on the Stack Card.

An object stream is opened, which is horizontally scrollable.

Each Quick Card has Header, Content and Footer.

It provides navigation (e.g. Object Page) and can contain Actions.

Link List Card

Key capabilities

Two variants: List of Links or Carousel of Images

Content can be static (hard-coded) or dynamic (from data source)

Also navigation can be static (fix link) or dynamic (e.g. Object Page)

By using the „fixed card layout“ the list can have up to 6 entries

With the „resizable card layout there is no limit (see more by enlarging)

For the Carousel variant there is no limit to the number of images

Analytical Card

Key capabilities

Header area can contain a KPI area with colored KPI value, and several optional features like a Trend arrow or Filters

Eight chart types are supported in the content area

Most important chart types

Line (e.g. to show a trend over a period of time)

Bubble (e.g. to show data of three dimensions in a 2D chart)

Column (e.g. to emphasize the actual values and not a trend over time)

Stacked Column (e.g. when sum of values is as important as one value)

Donut (e.g. to visualize the part as percentage of the whole)

Navigation and Interaction

Main use of the Overview Page is to **connect applications**, therefore navigation is a must-have
Each type of card has navigation capabilities (either header and/or content area)
The Stack Card has a built-in navigation to the Quick View Cards
Navigation to other Fiori Apps **highly improves** the usability of the Overview Page
Also external navigation to e.g. URLs is supported and can be useful as well
The Overview Page is generally accessed by the Fiori Launchpad, where it is clickable as a tile
